Data Analysis for Microsoft Studios

Name: Chemutai Annolyne Class: PartTime

Overview

Objective: The objective is to examine data on movies, determine why such movies perform they way they do, and recommend the best types of movies MICROSOFT's new studio should produce to increase business returns and profitability.

Data Sets:

I have two datasets obtained from the above sites for this analysis. The data sets are named \*bom.movie\_gross.csv (obtained from Box Office Mojo website), and tmdb\_movies.csv (obtained from TheMovieDB website).

The information helps us to understand movie performance, genres/combinations of genres that perform better in the box office, and whether production costs and release dates influence movie performance.

The datasets are suitable for the analysis as they provide information on the following:

- 1.Production budgets
- 2.Best perfoming Studios
- 3. Gross earnings (both domestic and worldwide)
- 4.Release Dates

## REQUIRMENTS

- 1. Import Relevant Modules
- 2. Read the Dataset and its structure
- 3. Data Wrangling/Cleaning
- 4. Data Analysis and visualization
- 5. Recommendation to Microsoft

```
In [ ]: #Import the nessecary tools for analysing data with python
    import pandas as pd
    import numpy as np
    from matplotlib import pyplot as plt
    import seaborn as sns
```

Lets Explore the differents Data sets

Dataset 1: 'bom.movie\_gross.csv '

```
In [ ]:
        #Read the files path and data structure
        bom_movie_gross = pd.read_csv('bom.movie_gross.csv')
        bom_movie_gross.head()

Combined Data is clean and now we proceed to analysing.

## **EXPLAROTARY DATA ANALYSIS**

## Visualization

1. Focus will be on comparisons between top movies and bottom movies in terms of genres, release month, studio, popularity, vote\_count, and vote\_average.

Visualizations will help identify some of these relationships and what they mean to Microsoft's production studio. For example, is there a correlation between popularity and box office? Other

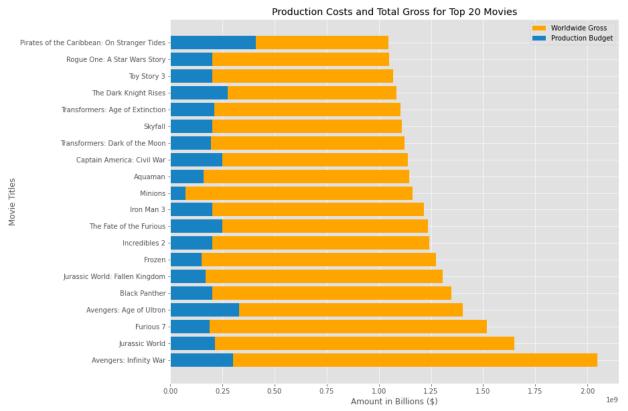

questions would be, does the release month affect the popularity and movies' box office? And are there any relationships between production costs, popularity, and worldwide grossing.

We are trying to answer below questions

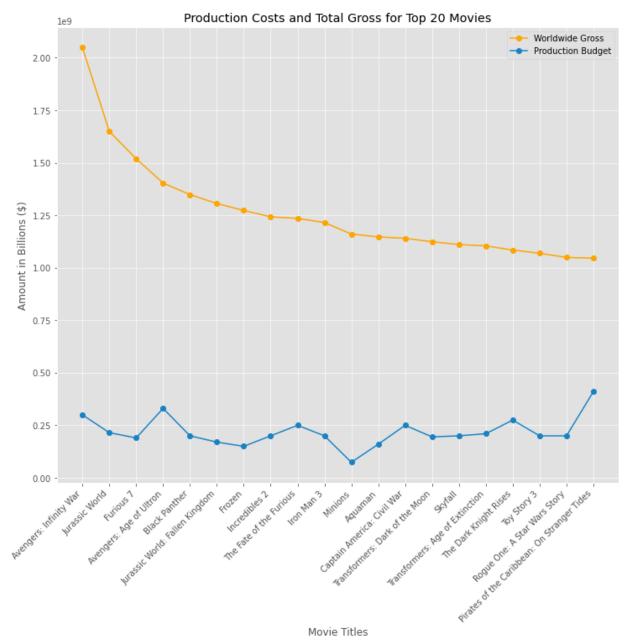

1.Production Budget vs Box Office figures 2.Understanding the relationship between production budgets and worldwide gross can help predict, to some level, whether investing more in movie production will result in high grosses.

As a result, an horizontal bar chart that compares costs vs revenues for the top 30 and bottom 20 movies will be appropriate for this analysis.

```
In [ ]: # Getting the top 20 movies
        top_20_movies = combined_movie_data.sort_values('worldwide_gross', ascending=False).he
        #reset the index for top_20_movies
        top_20_movies.reset_index(drop=False, inplace=True)
        # Setting the style
        plt.style.use('ggplot')
        # Create the figure and axes objects
        fig, ax = plt.subplots(figsize=(12, 10))

Monthly Release Dates for the top 100 Movies

Here, we need to understand which month saw the release of the most movies from the top 200 list. This will help in comparing whether the release month plays any role on a movie's audience reception

```
In []: # Get the top 200 movies
    top_200_movies = combined_movie_data.sort_values('worldwide_gross', ascending=False).h

# Reset the index for this dataframe
    top_200_movies.reset_index(drop=True, inplace=True)

# Group the movies by month and count the number of movies in each month
    movies_by_month = top_200_movies['month'].value_counts().reindex(['Jan', 'Feb', 'Mar',
```

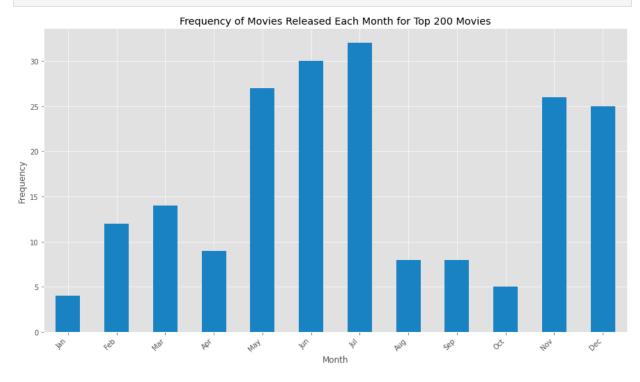

```
# Create the figure and axes objects
fig, ax = plt.subplots(figsize=(15, 8))

# Plot the data as a bar chart
movies_by_month.plot(kind='bar', color='#1984c5', ax=ax)

# Set the x-axis tick locations and labels
ax.set_xticklabels(movies_by_month.index, rotation=45, ha='right')

# Set the axis labels and title
ax.set_xlabel('Month')
ax.set_ylabel('Frequency')
ax.set_title('Frequency of Movies Released Each Month for Top 200 Movies')

# Show the plot
plt.show()
```

Studios with the Highest number of Movies in Top 250 List

```
In []: # Getting the top 250 movies
    top_250_movies = combined_movie_data.sort_values('worldwide_gross', ascending=False).h

# Reset the index for this dataframe
    top_250_movies.reset_index(drop=True, inplace=True)

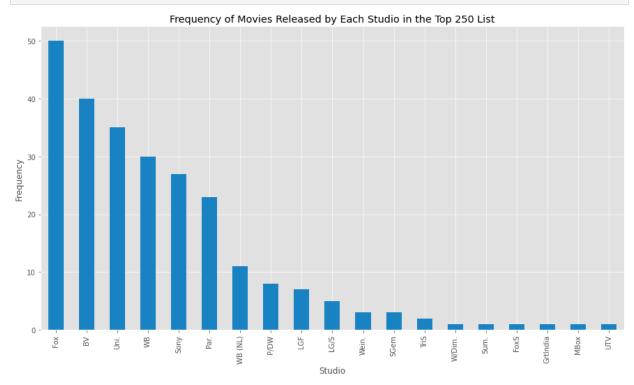

# Group the movies by studio and count the number of movies by each studio
    movies_by_studio = top_250_movies['studio'].value_counts()

# Create the figure and axes objects
    fig, ax = plt.subplots(figsize=(15, 8))

# Plot the data as a bar chart
    movies_by_studio.plot(kind='bar', color='#1984c5', ax=ax)

# Set the axis labels and title
    ax.set_xlabel('Studio')
```

```
ax.set_ylabel('Frequency')
ax.set_title('Frequency of Movies Released by Each Studio in the Top 250 List')
# Show the plot
plt.show()
```

```
In []: top_250_movies = combined_movie_data.sort_values('worldwide_gross', ascending=False).r

# Reset the index for this dataframe

Recommendations based on Analysis

Analysis reveals significant correlations between various factors, indicating opportunities for Microsoft's new studio to thrive in the film industry.

The examination aimed to uncover relationships between production costs and box office performance, release month and box office performance, as well as production studio and box office performance. Results and visualizations suggest a strong association between production studio and performance. However, correlations are notably weaker regarding production budget and release month.

Based on these findings, I propose four strategic actions for Microsoft's movie development process, listed in order of priority:

1.Forge Partnerships: Collaborate with established production studios. Fox emerges as the frontrunner, boasting approximately 49 movies in the top 250, closely trailed by (BV) Pictures—a subsidiary of Walt Disney Studios—with 44 movies. Following suit are Uni studios with 39 movies, (WB) Pictures with 28 movies, alongside Sony and Par Pictures with 25 and 23 respectively. These studios represent key players that have effectively dominated the market, consistently delivering highest-grossing films. Their success translates to substantial profits for parent companies and shareholders. Consequently, they offer valuable opportunities for Microsoft Studios to glean insights from or potentially collaborate with.

2.Consider Production Costs: While of lower priority, Microsoft's new studio should factor in production costs. Avoiding movies with budgets below \$100 million is advisable, as they often yield minimal or negative returns.

3.Optimize Release Timing: Explore releasing movies during peak months for box office success, such as May, June, July, and November and December. These months typically witness the release of highest-grossing films, indicating increased audience engagement. Collaborating with

seasoned studios can provide valuable insights into the factors driving audience behavior during these periods.

4.Evaluate Additional Factors: Explore additional factors beyond the scope of this analysis that may influence box office performance, such as marketing strategies, audience demographics, and critical reception. Incorporating these considerations into the movie development process can further improve Microsoft's chances of success.
